

## Dwarf Conifers

Evergreens are a great addition to a landscape, but they often outgrow their space after a number of years. Garden (dwarf) conifers may be the answer for gardeners with limited space.

These are slower-growing evergreens that stay smaller in size with minimal pruning. Garden conifers are grouped according to growth rate. Miniatures grow less than 1" per year; dwarves grow 1-6" per year; intermediates grow 6-12" per year; and large grow over 12" per year.

Cultivated dwarf conifers are available in a variety of colors, including blue, gold, silver, and variegated, in addition to the typical green. They need the same care and maintenance as other conifers — regular watering if rainfall is insufficient and proper mulching.
