

## Houseplant Care

Many plants are easy to grow in the home. Different types need very different amounts of water and sunlight so it is important to know the specifics for the particular plants that are being grown. Although regular watering is essential, it is important to make sure the plant does not get too little or too much water.

During winter houseplants are exposed to lower humidity and warmer daytime and cooler nighttime temperatures. Winter is also when most houseplants are in their yearly resting or dormant

period. Because of this, you may need to adjust your plant care routine during winter. Fertilize only when plants are actively growing during late spring, summer and early fall. The best time to repot a houseplant is when the growth season is commencing – usually early spring.
